

# THE BIG DELIGHT

Calinda®

## FRUIT QUALITY

Calinda's fruit is long and broadly conical. Uniform in shape, the attractive fruits have a good red colour with a beautiful gloss. They are very juicy, with excellent flavour and texture. The average fruit weight is high and regular: it is never too low, not even at the end of the season! Calinda has a distinctive texture, which, compared to other South European cultivars, is particularly soft and delicate. A real delight, Calinda is perfectly suited to the tastes of consumers in Northern Europe. The fruit and plant are well adapted to the varying weather conditions of the Mediterranean. The fruit maintains its firmness, yield and Brix value under dry, humid, hot and cold weather conditions. Add to this Calinda's excellent transportability and you have a unique variety.

## CALINDA AND FORTUNA WEEKLY YIELD

## DISEASE SUSCEPTIBILITY

Calinda is highly resistant to fruit rot (*Botrytis cinerea*) and crown rot (*Phytophthora cactorum*) and is not susceptible to mildew (*Podosphaera macularis*) either, making it easy to comply with stringent low residue level requirements.

## YIELD

The combination of its medium to high yield with Calinda's easy picking and early harvest make it a surefire winner: a highly profitable cultivar.

# Calinda®

## GROWING EXPERIENCE

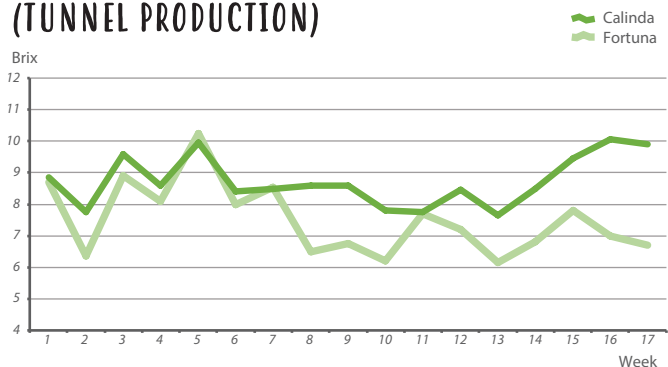

Calinda is relatively easy to cultivate. A plant distance of 22 to 30 cm produces a healthy harvest throughout the season. Harvesting starts at the same time as other early varieties. The first fruits are relatively large and well shaped. As temperatures rise, yield and picking frequency also increase, but without sudden peaks or drops in production. Development is balanced, ensuring stable production with few nutrient demands. The cultivar is well adapted to different types of soil and fertilizer; a general NPK fertilizer with microelements suffices.

## CALINDA COMPARED TO FORTUNA

	Calinda	Fortuna
Yield per plant (g)	800	925
%Class 1	90%	85%
Average Brix	8,5	7,5
Shelf life*	5	3
